ATAD | Doxygen documentation

Doxygen is a documentation generator, a tool for writing software reference documentation. The **documentation is written within code**, and is thus relatively easy to keep up to date. Doxygen can cross reference documentation and code, so that the reader of a document can easily refer to the actual code (*wikipedia*).

Installation

You must ensure you have the doxygen package installed.

```
$> sudo apt install doxygen
```

Documenting code

Use the following convention for all your functions:

```
/**

* @brief Retrieve the real part of the `Complex` number.

*

* This function receives a pointer to an existing complex number

* and returns, by reference, the real part of the number.

*

* @param c [in] PtComplex pointer to the `Complex` number

* @param re [out] Pointer to variable to hold the value

*

* @return COMPLEX_OK and real part in 're'

* @return COMPLEX_NULL if 'c' is NULL

*/
int complexRe (PtComplex c, double *re);
```

- @brief is used to provide a summary of the function (mandatory);
 - The following lines can be used to provide any other details (opcional);
- @param is used for each parameter of the function, followed by the name of the parameter, [in] or [out] whether its an input or output (by reference) parameter, respectively;

• @return – is used to indicate all possible return values and side-effects of the function (one for each, also, if multiple return values are possible).

A more complete and complex example is available at, e.g., Doxygen usage example (for C) — Matteo Franchin's corner.

Usage

Having you code documented, we must be able to generate the documentation. Doxygen can generate a lot of different outputs, but we'll be interested solely on the *HTML* output, that can be read in a browser.

The Doxyfile must be in the same directory as all your source files.

Template Doxyfile

This file is already included in the CProgram_Template GitHub repository.

For other projects, you can download a premade version using wget (assumes working directory):

Generating doxygen documentation

This will effectively produce the desired documentation, inside a newly created html folder:

```
$> doxygen Doxyfile
```

Manual configuration

You can skip this section if you are using the premade Doxyfile.

1. Inside your working directory (contains your documented source files), execute the following command:

\$> doxygen -g

This will create the default doxygen configuration file named "Doxyfile".

- 2. You must edit the "Doxyfile" in any text editor of your choice:
 - Find "EXTRACT_ALL" and change it to YES.
 - Find "GENERATE_LATEX" and change it to NO.
 - Find "DISABLE_INDEX" and change it to **YES**.
 - Find "GENERATE_TREEVIEW" and change it to **YES**.
- 3. Save this file. You can copy it later to any other working directory, avoiding following steps 1 and 2.
